

In the Claims:

1. (original) Apparatus for warning of differential pressure during the opening of a pressure-loaded closure device (1) of an opening in the aircraft fuselage by means of an opening mechanism (4; 100, 105), characterized in that an air guide passage (6; 206, 207) is provided from the side with higher pressure (P) to the side with lower pressure (A), which is closeable by a valve (5; 209), whereby the valve (5; 209) is controllable with a control lever (4; 208) placed in operative connection with the opening mechanism (4; 100, 105), and produces an acoustic signal upon the opening of the valve (5; 209) and an existing differential pressure.

2. (original) Apparatus according to claim 1, characterized in that the valve (5) is connected with a signal producing device (8), for example a whistle for the producing of an acoustic signal.

3. (original) Apparatus according to claim 1, characterized in that the valve (5) itself comprises means for the producing of an acoustic signal, for example a hissing or rushing.

Claims 4 to 19 (canceled).

- 1     **20.**   (new) Apparatus according to claim 1, characterized in that  
2           the control lever (4) is embodied as a door operating  
3           lever, which is placed in operative connection with the  
4           valve (5) via a mechanical connection (9), such as a Bowden  
5           cable arrangement or a tension cable arrangement or a  
6           lever/rod mechanism or a transmission.
- 1     **21.**   (new) Apparatus according to claim 1, characterized in  
2           that, in the operation of the control lever (4) a first  
3           condition is reached, in which the valve (5) opens and, for  
4           an existing differential pressure, an acoustic warning  
5           signal is provided.
- 1     **22.**   (new) Apparatus according to claim 21, characterized in  
2           that the operating of the control means results in a second  
3           condition, if no differential pressure exists and thus the  
4           opening process is able to further proceed.
- 1     **23.**   (new) Apparatus according to claim 1, characterized in that  
2           the opening means further comprises a flap (4A) that covers  
3           the door operating lever, and an operative connection (9A)  
4           is provided between valve (5) and flap (4A), whereby the  
5           valve (5) is opened upon operation of the flap (4A).
- 1     **24.**   (new) Apparatus according to claim 1, characterized in that  
2           the air guide passage (6) is provided in the door (1).

- 1     **25.**   (new) Apparatus according to claim 1, characterized in that  
2           the air guide passage (6) is provided in a door frame (2)  
3           surrounding the door (1).
- 1     **26.**   (new) Apparatus according to claim 2, characterized in that  
2           the air guide passage (6) and/or the signal producing  
3           device (8), in connection with a differential pressure,  
4           guides the airflow in a targeted manner in direction of the  
5           operating hand.
- 1     **27.**   (new) Apparatus according to claim 1, characterized in that  
2           the air guide passage is embodied as connection pipe (6) or  
3           as a different type of air channel.
- 1     **28.**   (new) Apparatus according to claim 1, characterized in that  
2           the air guide passage is provided from the passenger cabin  
3           (P) via a through-flow opening (206) in an aircraft door  
4           (1) in the area of the hand lever box (106) to the outside  
5           environment (A).
- 1     **29.**   (new) Apparatus according to claim 28, characterized in  
2           that the air guide passage proceeds via the valve (209) and  
3           a connected air guide device (207) to the through-flow  
4           opening (206).

1     **30.**   (new) Apparatus according to claim 28, characterized in  
2           that the air guide device (207) is positioned by means of  
3           a flange (210) on the door structure (110) in the area of  
4           the hand lever box (106).

1     **31.**   (new) Apparatus according to claim 1, characterized in that  
2           the control lever (208) is provided on its free end with a  
3           roller (218), which, for the closing of the valve (209),  
4           presses a slide bolt (215) with connected seal (217) on a  
5           valve flange (213), as well as for opening the valve (209)  
6           the spring-loaded slide bolt (215) is released through  
7           rotation of the control lever (208) and thus clears an  
8           out-flow opening in the valve flange (213).

1     **32.**   (new) Apparatus according to claim 31, characterized in  
2           that the opening in the valve flange (213), in-flow opening  
3           (212) on the valve housing (211) as well as the seal rubber  
4           (217) are embodied for producing a hissing/rushing acoustic  
5           signal.

1     **33.**   (new) Apparatus according to claim 31, characterized in  
2           that the seal rubber (217) is loaded in direction of the  
3           out-flow opening of the valve (209) with an existing  
4           pressure difference, and thereby closes the opening  
5           additionally to the pressure of the slide bolt (215).

1     **34.**   (new) Apparatus according to claim 1, characterized in that  
2           the control lever (208) is arranged on the locking shaft

(105) of the door opening mechanism (100), and through rotation of the locking shaft (105), the free end of the control lever (208) is moved in a circular arc path, whereby an opening of the valve (209) takes place before the door opening mechanism (100) completely releases the aircraft door (1).

35. (new) Apparatus according to claim 1, characterized in that, for the closed condition of the valve (209), an over-travel of the control lever (208) past the dead center point is provided on the motion path of the free end of the lever (208).
